

Check your database access

Group 4b · Ride-hailing trips · do this before week 1

Host	internship-db.coh86gwevtxb.us-east-1.rds.amazonaws.com
Port	5432
Database	internship
Username	group4b
Password	sent to your group lead
SSL mode	require
You read from	raw_rides
You write to	group4b

Never set up a database connection before? Follow **Connecting to the internship database** first — the full walkthrough in the general channel — then come back to this sheet. DBeaver, pgAdmin and psql all work.

Run these three, in order

Copy each one, run it, and check you get what is described. If all three work, you are set up correctly.

1. Can you read the data?

```
SELECT count(*) FROM raw_rides.trips;
```

Expected: **28,112**. If you get a number, you have read access.

2. Can you see all four tables?

```
SELECT table_name FROM information_schema.tables  
WHERE table_schema = 'raw_rides' ORDER BY table_name;
```

Expected: **four table names**. These are the tables you will work with for the whole internship.

3. Can you write to your own schema?

```
CREATE TABLE group4b.access_test AS SELECT 1 AS it_works;  
SELECT * FROM group4b.access_test;  
DROP TABLE group4b.access_test;
```

Expected: a table is created, returns **1**, then is deleted. This is where your cleaned data will live from week 3.

One thing that should NOT work

Try this. It is **supposed** to fail — that is how you know your work is private from group4a.

```
CREATE TABLE group4a.test (x int);
```

Expected: **permission denied for schema group4a**. If this succeeds instead, tell us immediately.

If something fails

Connection hangs, then times out	Check your internet. If it is fine, message your group lead.
password authentication failed	Retype the password by hand. Pasting often adds a space at the end.
relation ... does not exist	Check the schema name. You read from raw_rides, not from another group's.
permission denied for schema raw_rides	You are trying to write to the raw data. Read only — write to group4b.

Everyone in the group should run these on their own machine, not just one person. A connection that works on the group lead's laptop tells you nothing about yours.
